Famine Early Warning Systems Network

FEWS NET

The Purpose:

To collaborate “with international, regional and national partners to provide timely and rigorous early warning and vulnerability information on emerging and evolving food security issues.”

The Challenge:

How do you predict food security crises and generate policy-useful assessments?

2009 Hunger Map

Be part
of the solution

Category	1	2	3	4	5	6
Undernourished	<2%	3-9%	10-19%	20-24%	≥25%	Insufficient data
Description	Extremely low	Very low	Moderately low	Moderately high	Very high

Context of FEWS NET

Challenges of Food Security

Three Domains

- Food Availability: Regional agricultural production.
 - Satellite-derived remote sensing data
- Food Access: Ability to engage fully in local markets.
 - Field analysis of market conditions
- Food Utilization: Individual ability to biologically utilize nutrients.

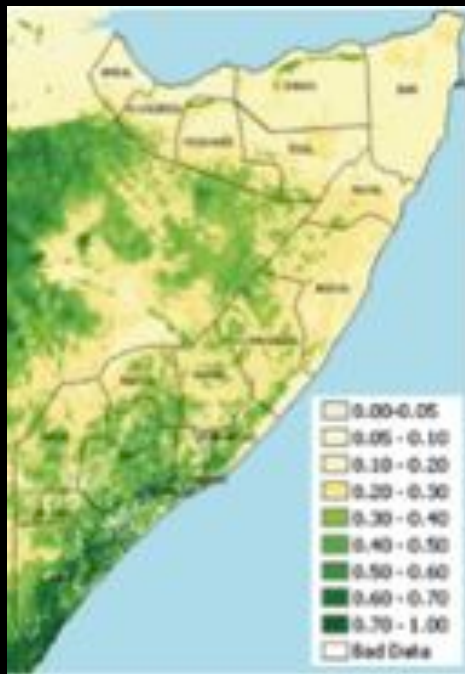

Adapted from Gary Eilerts, 2010

Assessing Food Security: “A Convergence of Evidence”

- Biophysical factors
 - Rainfall
 - Vegetation and Production Indices
 - Seasonal and Climate Change
 - Pests
- Socioeconomic and livelihood context
 - Terms of trade, Prices
 - Disease, Malnourishment
 - Civil Insecurity, Refugees
 - Food Access

NDVI

Somalia, July 2010

Normalized Difference Vegetation Index (NDVI)

- Greenness Maps: Indicator of the amount and vigor of vegetation.
- Primarily studied for year-to-year anomalies in 8km x 8km pixels.
- Calculated using the spectral reflectance in the near infrared and red wavelengths measured by the AVHRR sensor.

$$\text{NDVI} = \frac{\text{NIR} - \text{RED}}{\text{NIR} + \text{RED}}$$

RFE

Somalia, July 2010

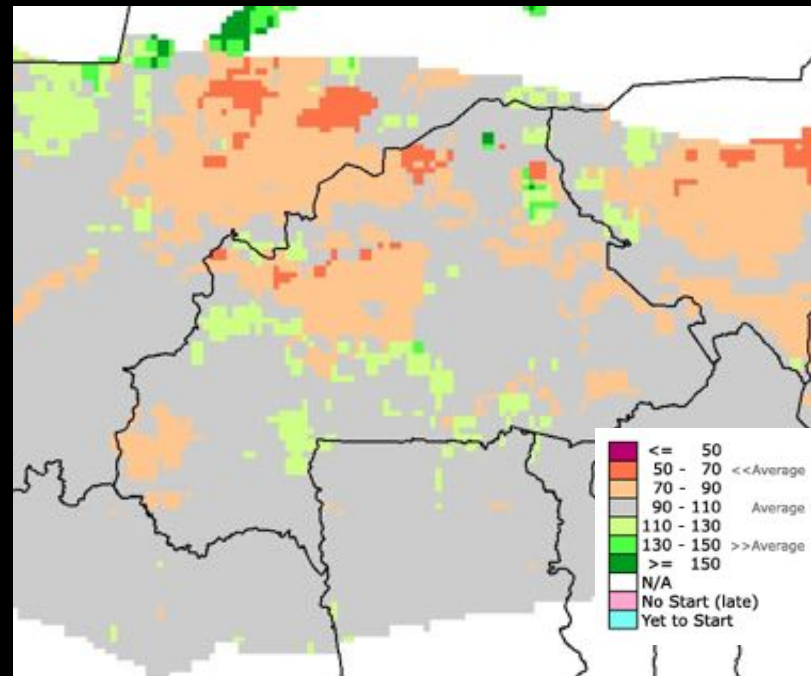

Rainfall Estimation

- Automated product that incorporates Meteosat infrared data, rain gauge data, and microwave satellite observations.
- Primarily studied for year-to-year anomalies in 10km x 10km pixels for 10 day intervals.
- Source information for WRSI and other derivative indices.

WRSI

Water Requirement Satisfaction Index (WRSI)

- Incorporates rainfall estimates from the current growing season and the seasonally and crop specific evapotranspiration rates to forecast a spatially specific projected crop yield at the end of the season.
- 10km x 10km pixels for 10 day intervals.

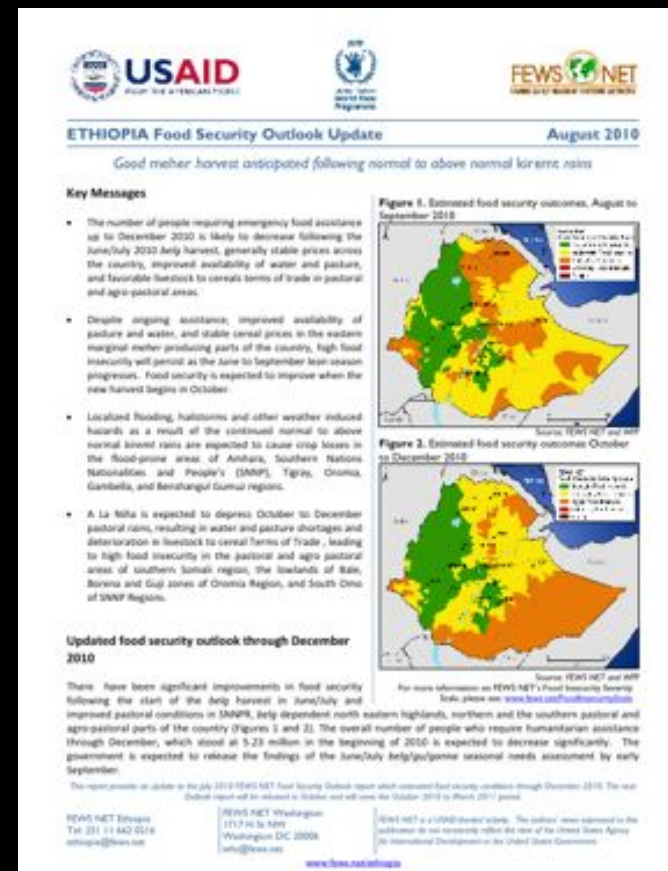

Burkina Faso, October 11-20, 2010

What are the types and the timing of knowledge communicated to policy makers in Famine Early Warning Assessments?

Brown, ME and EB Brickley. (2010) The Use of Environmental and Socioeconomic Indicators of Food Security in Early Warning Assessments. Submitted to *Environmental Research Letters*.

Additional Questions

- How do food security analysts use remote sensing data in Sub-Saharan Africa?
- Are there regional distinctions in data usage?
- Does the data usage respond to seasonal environmental change?
- Does the data usage respond to changes in agricultural productivity?

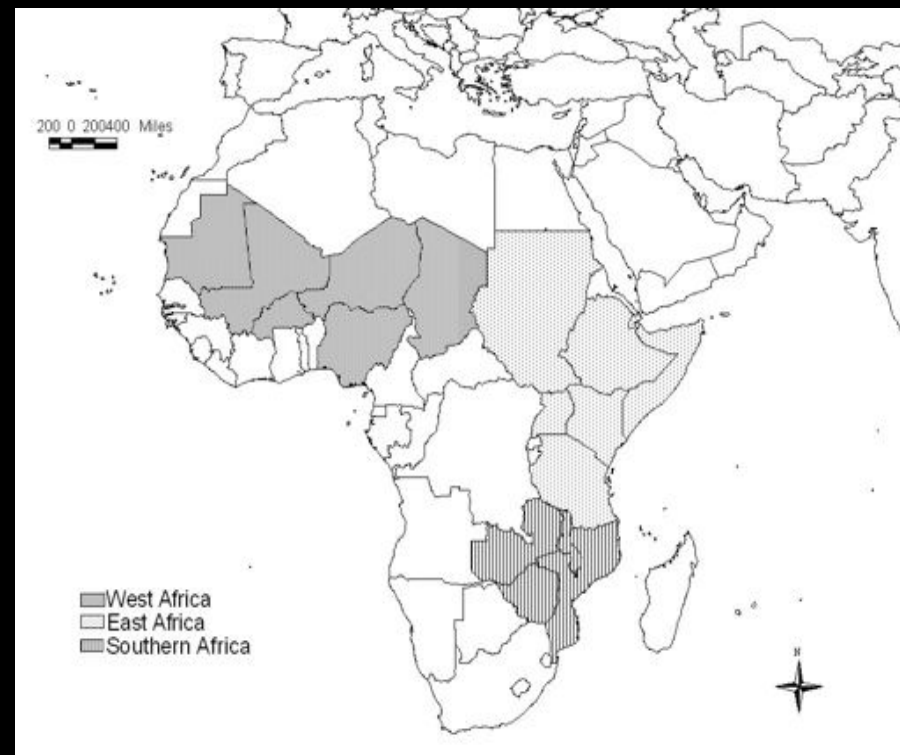

Domain of Analysis

Textual Analysis of 72 types of data inputs
in 1342 Food Security Assessment
Reports

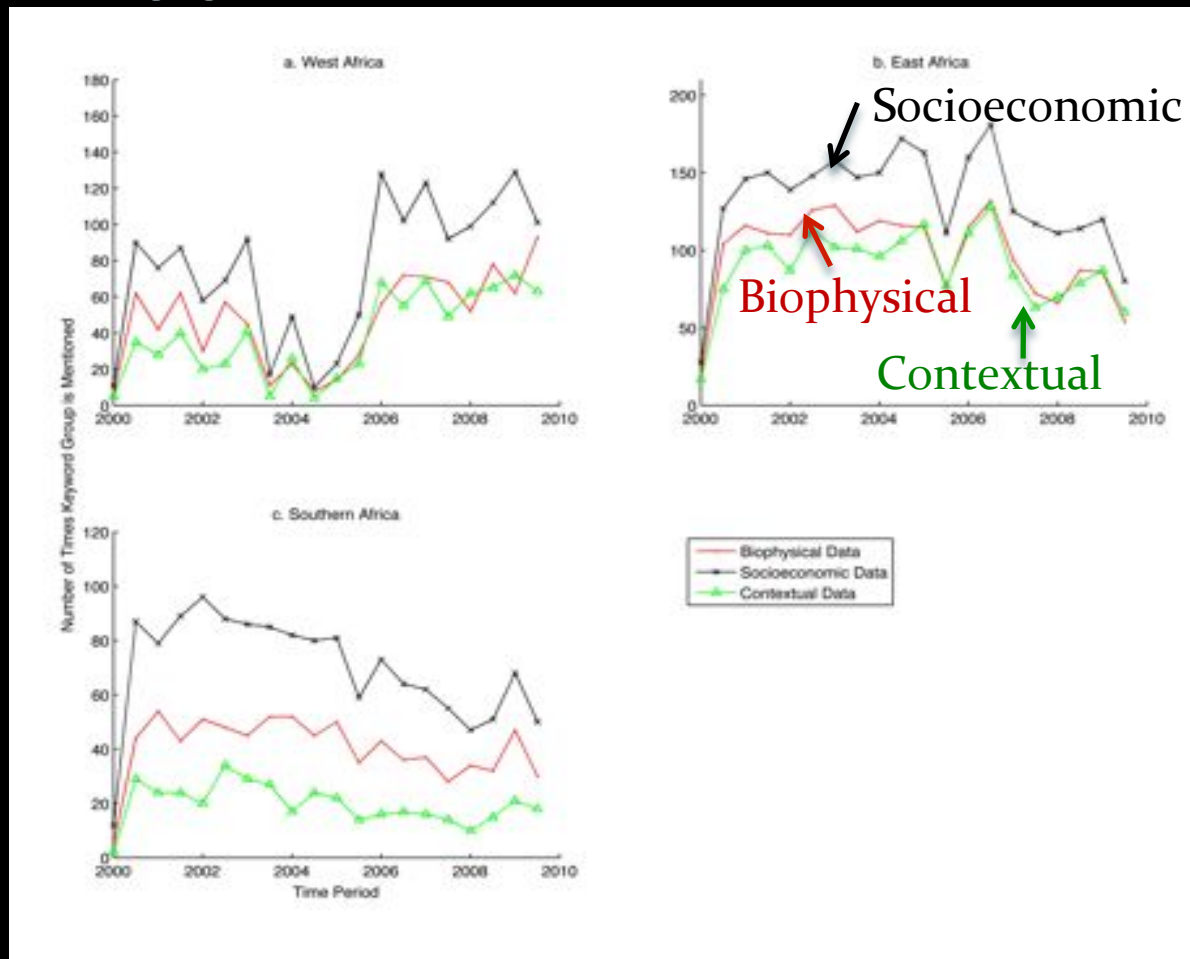

- Spatially: 3 regions, 17 countries
- Temporally: 10 years, 2000-2009
- Seasonally: Growing vs. Dry
- By Production: Good vs. Bad Yield Years

	West Africa	East Africa	Southern Africa
NDVI	36%	46%	3%
RFE	74%	99%	81%
WRSI	17%	10%	6%
Rainfall	100%	100%	100%
Livestock	96%	98%	55%
Production	100%	100%	100%
Pests	37%	16%	14%
Prices	100%	99%	99%
Food Access	88%	91%	89%
Terms of Trade	66%	45%	26%
Civil Insecurity	23%	61%	2%
Disease	63%	85%	53%
Refugee	60%	65%	3%
Malnourishment	43%	64%	32%

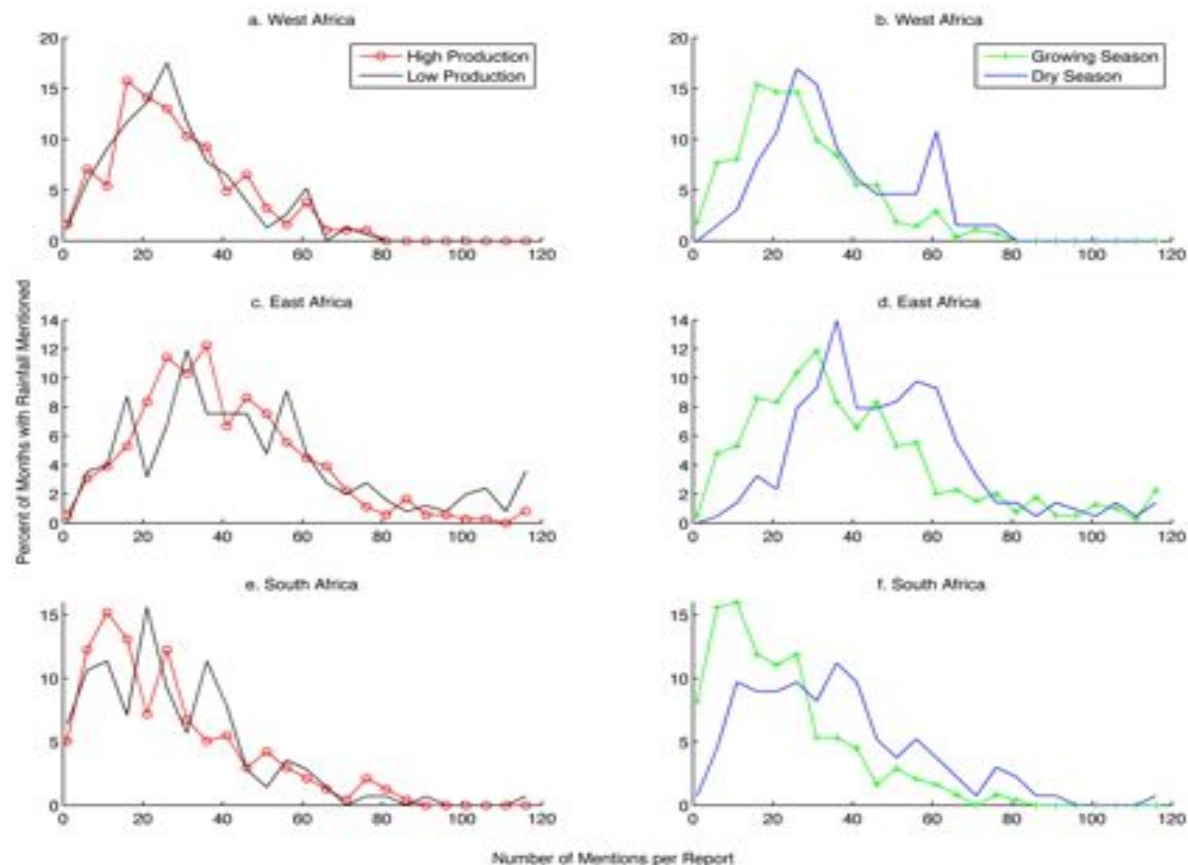

Brown and Brickley, 2010

What type of data is utilized?

Brown and Brickley, 2010

When is biophysical information utilized?

Remote Sensing Data

- Overall, analysts use:
 - NDVI: 28%
 - RFE: 84%
 - WRSI: 10%
- Analysts in Southern African countries use RFE almost exclusively.

Brown and Brickley, 2010

Explanations

- ‘A possible explanation on the relatively low incidence of the use of WRSI is that it was introduced to the field towards the end of FEWS NET-1, around 2005; while NDVI and RFE has been in use in the project since 1988 and 1991 respectively.’
 - Felix Lee, Deputy Chief of Party, FEWS NET

Future Challenges

- Bridging the disciplinary divide
 - Expanding capacity of social analysts to incorporate biophysical data.
 - Tailoring the products derived from biophysical data to be more policy useful.
- Properly weighting each data category.
- Improving regional and temporal specificity.
- Providing “earlier” early warning.
- Using a consistent vocabulary.
- Understanding the underlying nutritional topography.
